15. SUPPLEMENTARY NOTES

16. ABSTRACT

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended 1977, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions thereof.

The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, at Research Triangle Park, North Carolina 27711.

PART C.	SUMMARY OF AIR POLLUTANT EMISSIONS IN INTERSTATE AQCRs	368

ABSTRACT

This report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended in 1977, and of EPA Regulations, Title 40, Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, for intrastate and individual interstate portions of Air Quality Control Regions, and for total interstate Air Quality Control Regions.

The data compilations presented result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system, the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina.

ACKNOWLEDGMENT

The National Emissions Report series is the result of the generous cooperation and diligent efforts of personnel in many areas of government and private industry. Their contributions are gratefully acknowledged.

1977 NATIONAL EMISSIONS REPORT

Introduction

This report summarizes, by source category, estimates of emissions in 1977 of those air pollutants for which national standards have been promulgated. These pollutants, which are called criteria pollutants, are particulates, sulfur oxides (SO_x), nitrogen oxides (NO_x), hydrocarbons (HC), and carbon monoxide (CO). National Emission Reports, which are a series of annual reports, are compiled from information contained in the National Emissions Data System (NEDS) on emission sources. Compilations of emissions data are presented for the nation as a whole, for individual states, for intrastate Air Quality Control Regions (AQCRs), for respective state portions of interstate AQCRs, and for interstate AQCRs. Figure 1 is a map illustrating AQCR boundaries.

This report represents the best available indicators of national emissions for the calendar year 1977. Table 1 shows EPA-calculated national emissions estimates that are independent of NEDS data for 1977. Readers interested only in national emissions estimates should refer to this table for total national emissions and national emissions for major source category groupings. More detailed emissions summary reports for the nation, each state, and AQCR, based on NEDS data, are given in Parts A, B, and C, the body of the report, pages 1-420. The estimates reported are based on emission-source records contained in NEDS as of February 1980. State-submitted Annual Reports that were successfully updated in accordance with NEDS files prior to this date also are included. Thus, the data are generally comparable to data collected for the development of State Implementation Plans (SIPs), but include revisions and updating information where they are available. The following text sections provide a detailed technical description of the procedures that were used to develop the emissions data.

Emissions Inventory

Much detailed information concerning sources and their operations is needed for the development of the emissions inventory by which the impact of source emissions on an area's air quality can be assessed at the state or local level. The NEDS, operating through the EPA Office of Air Quality Planning and Standards (OAQPS), processes source and emissions information for the whole nation. Since NEDS operations were initiated in 1971, the National Air Data Branch (NADB) of OAQPS and EPA Regional Offices have been engaged actively in the collection and analysis of air pollutant emissions. A detailed description of the NEDS and of its methodology for compiling an emissions inventory is available in *OAQPS Guideline AEROS Manual Series, Volume II: AEROS User's Manual* (EPA-450/2-76-029). Brief discussions of the NEDS basic elements, used for the preparation of the National Emissions Reports, are given below.

NEDS Point-Source File

The NEDS point-source file contains data concerning stationary facilities that are individual emitters of relatively large quantities of one or more air contaminants. A point source is defined for state reporting purposes as a facility at which the annual emissions of any one criteria pollutant equal or exceed 100 tons (90.7 metric tons) per year. Nearly all point-source data originate at state air pollution control agencies. In general,

Structural fires	70	0	5	50	250
Gasoline station evaporation loss	0	0	0	1,060	0
Solvent evaporation loss	0	0	0	1,910	0
Grand total (point and area)	14,800	29,900	25,200	29,600	109,800

[1]Does not include area source fugitive dust emissions (reentrainment of dust from paved roads, unpaved roads, unpaved airstrips).

[2]Hydrocarbon emission estimates are calculated as volatile organic compound (VOC) emissions. Emissions of methane, ethane, methylchloroform, and freon 113 are not included in these totals for some source categories. NEDS emissions are all calculated as total hydrocarbons.

[3]Highway motorcycle emissions are not included in NEDS summaries.

individual emission points are defined within such a facility to represent the emissions from individual stacks and processes. There may be emitting points at a facility that individually have emissions of fewer than 100 tons per year, but emissions from such points are included in NEDS if the criterion of emissions of 100 tons per year for the entire facility is met. Data for other facilities, regardless of emissions, may also be included if the data are reported from state files.

At the time of this report, NEDS contains data from approximately 205,000 emitting points at 55,000 facilities in all states, the District of Columbia, and three territories. Considerable information is stored for each point source. For example, NEDS stores data on annual operating rates, or activity levels, of a process. More specifically, these rates may relate to the amount of fuel consumed by a boiler, quantity of product manufactured in an industrial process, or some comparable measure. Information identifying existing air-pollution control devices and their efficiencies is also recorded. These and similar data are used to determine source emissions according to the procedures outlined in the following discussion of the NEDS emission factor file.

NEDS point-source data are reviewed continually through extensive and cooperative efforts by the National Air Data Branch, the EPA Regional Offices, and the state and local air-pollution control agencies. Data were originally acquired from state records and converted to the NEDS format primarily through EPA internal and contractual efforts. Under provisions of the Clean Air Act and SIP requirements, state agencies must submit revised source data in NEDS format to EPA annually for (1) each source achieving final compliance with an SIP emission-limitation regulation or strategy, (2) each new or modified source receiving approval to begin construction or operation, and (3) each source that terminated operations during a reporting period. Thus, the basic data of the NEDS are revised and updated periodically and reflect progress under the SIPs.

The point-source file contains the data reported to NEDS by the state air-pollution control agencies. Some states still rely on manual procedures for maintenance of their own source/emissions files. The majority of states have, however, installed, or are in the process of installing, automated data systems and EPA has assisted many of the states in these efforts. The most common system in use is one designed and maintained by EPA: the Emission Inventory/Permits and Registration Subsystem (EIS/P&R) of the Comprehensive Data Handling System (CDHS). EIS/P&R has the capability to output data in NEDS format for reporting to EPA. A number of systems designed and maintained by the states also have a similar capability. Data can be easily reported to NEDS by means of data format conversion programs.

NEDS Area-Source File

In NEDS, area sources are all emissions sources not identified as point sources. For example, the NEDS area-source file contains data on all mobile sources such as motor vehicles, aircraft, and railroads; small stationary sources; and miscellaneous sources such as forest fires, agricultural burning, and retail gasoline marketing operations. Unlike data for point sources, however, data for each of these small individual sources are not stored in NEDS. Rather, estimates of total emission levels for specific categories of area sources are stored for individual geographic areas. Generally, data relevant to area-source emissions (for example, total amount of gasoline consumed by all motor vehicles) are grouped for each of the approximately 3100 counties or county equivalents in the United States. Area-source data are developed primarily from reports published by other Federal agencies and, when possible, from valid data collected by state air-pollution control agencies. Detailed procedures for the determination of levels of area source activity are discussed in *AEROS User's Manual, Volume II* (OAQPS No. 1.2-039), EPA-450/2-76-029. Under current SIP requirements, states are not required to submit area-source data to EPA. Therefore, area-source data are updated annually by NADB; states are given the opportunity, however, to review the EPA-generated area-source data for accuracy and completeness. In addition, a number of state agencies have voluntarily submitted their own area-source data for inclusion in NEDS. These data are reviewed for consistency with the NEDS point-source data and are added to the NEDS file if they are acceptable for inclusion.

NEDS Emission-Factor File

In normal NEDS operations, source emissions are calculated automatically via computer program, based on the data stored in point and area source files. The principal vehicle for these calculations is the NEDS emission-factor file. An emission factor is a statistical average--a quantitative estimate--of the rate at which a pollutant is released to the atmosphere (as a result of an activity such as combustion or industrial production) divided by the level of that activity. Thus, an emission factor relates the quantity of pollutants to an indicator of

activity such as production capacity or quantity of fuel burned. Because emission factors are statistical averages, they are not necessarily precise indicators of emissions from an individual source. When they are applied to a large number of sources, however, a reasonable estimate of total emissions can be obtained. In general, the larger the sample, the lower the percentage of error. Therefore, for the entire nation, an emission estimate based on emission factors may be quite precise, but for smaller geographic areas the percentage of error increases. Emission factors are usually determined from results of source tests in which quantities of air pollutants are measured from specific processes. Emission factors may also be determined from process material balances and engineering appraisals of particular processes. A collection of derived emission factors is given in *Compilation of Air Pollutant Emission Factors* (U.S. Environmental Protection Agency, Research Triangle Park, N.C., Publication No. AP-42, March 1975) and its supplements.

The emission factors in AP-42 and associated data maintained by NADB are related to the activity levels for sources covered by NEDS. Area-source emission factors are designated for each area-source category represented in NEDS. The emissions are determined by multiplying the appropriate emission factor by the activity level recorded.

Similarly, point-source emission factors are related to point-source activity levels through the NEDS Source Classification Code (SCC), determined and recorded for each point source. These codes give specific identification of the source (e.g., industrial coal-fired boiler, solid-waste incinerator, gray-iron cupola) and define the units of the activity level recorded in the point-source file. Appropriate emission factors are designated for each SCC and are multiplied by the activity level to calculate the emissions. Where a control device is indicated in the point-source file, the given control-device efficiency is included in the emission calculation so that estimated actual emissions are computed for all sources. Additionally, provision is made for the direct recording of emissions determined by stack tests or engineering material balances for specific sources. It is assumed that the determination of emissions by these latter methods provides a more precise estimate than the calculation of emissions by the application of an emission factor. Further, when the point-source file indicates that the recorded emissions estimates were determined by a source test or material balance, the computer program that calculates emissions will substitute these data for emissions estimates that were calculated through the use of factors.

Some SCCs do not have corresponding emission factors in the NEDS emission-factor file. These SCCs are general in nature (i.e., termed miscellaneous or unspecified) and are used for the categorization of point sources that are otherwise not classifiable. A source will fall in these categories when (1) no emission information is available, (2) the source is inadequately identified, or (3) the source is unique, or very unusual, and therefore cannot be assigned a specific SCC.

For some of the sources in such miscellaneous categories, emissions estimates may be derived by engineering analysis or judgment. The resulting emissions estimates are incorporated into the point-source file and carry the same weight as calculated emissions estimates. The National Emissions Reports are based on all emissions estimates in the NEDS point-source file, however derived.

The error caused by having no estimates for some point sources and "guess" estimates for a few others is insignificant when emissions are summarized for the nation as a whole; but that error may be fairly sizable for local areas in which a number of point sources could not be assigned a specific SCC. The evidence suggests that the problem of missing emissions estimates for a few point sources is not major when considered in relation to (1) the potential imprecision introduced through an application of emission factors to specific point sources, or (2) the imprecision introduced through the calculation of area-source activity levels for small geographic areas.

Reliability of Reported Emissions

Because an emissions inventory such as NEDS is often used as a basis for making important management decisions, it is imperative that the data therein be as accurate and precise as possible. Hence, when an inventory is developed, the question of reliability must be considered if the resulting emissions estimates are to be applied with any confidence.

Imprecision of emissions data is an inevitable result of the estimation techniques used to develop the data base, though these techniques are, for practical considerations, the best that are available. As noted previously, the use of emission factors and calculation of area-source activity levels for NEDS cause inherent variations, or

random errors, in the calculated emissions. Generally, as the number of observations on which emissions estimates are based is increased, the impact of imprecision of the data decreases. Thus, for the NEDS national emissions summary tabulation, which is based on a very large number of observations, imprecision is a relatively minor factor. For emissions summaries for smaller geographic areas (such as states and AQCRs), which are based on a smaller number of observations, the error potential increases.

Other factors that influence emissions inventory reliability are mistakes and biases in the reported data. Major mistakes input to NEDS are prevented by edit programs used to process input data or by review of NEDS output reports prior to publication of the National Emissions Report. Such data errors have been corrected for this report. It is likely that there are a number of other, relatively minor mistakes that remain that should have an insignificant impact on the reliability of reported emissions. Biases in the NEDS data are introduced as a result of inaccuracies, or deficiencies, in the techniques used to compile the data. In comparison with mistakes, biases usually represent a more subtle type of error because it is rarely apparent with biases that the resulting emissions estimates deviate from what the "true" values should be (as is often the case with many mistakes). As an example, the emissions from a source may be measured by a sampling technique that yields biased results. Another example is the use of a biased (i.e., nonrepresentative) emission factor to estimate the emissions from a number of sources.

For NEDS, biases are introduced principally through inaccuracies in the procedures used to compile NEDS area-source data and lack of complete and timely reporting of point-source data by state agencies. In addition the regulation prescribing reporting of point-source data (40CFR 51.321) includes an inherent bias since it requires reporting only from facilities identified as emitting over 100 tons per year. Emissions from fuel combustion not accounted for by reporting of point sources are generally included, instead, as area-source fuel use, but with less precision than if all fuel use were accounted for by individual point sources. Emissions from industrial process sources not reported as point sources are not accounted for, however. Thus, NEDS data may be biased low for industrial process emissions in cases where state agencies fail to report all major industrial process sources adequately as point sources or where emissions from facilities individually emitting less than 100 tons per year are collectively significant.

As a possible means of checking the reliability of NEDS emissions data, Table 1 shows EPA-calculated national emissions estimates for each of the five criteria pollutants according to the same major source categories as defined in the NEDS emissions summaries. These data are obtained from the data prepared for the report *National Air Pollutant Emission Estimates, 1970-1978* (EPA-450/4-80-002). The methodology used to derive these data relies upon essentially the same sources of information for emission factors and area-source calculation algorithms as used with NEDS. Differences between NEDS area-source data and totals reported in Table 1 are due primarily to the differences in the precision of the methods of calculation used. For NEDS, national emissions totals are obtained by summarizing individual county totals. National Trends Report emissions totals are obtained from one calculation performed at the national level by use of total national activity levels and national average emission factors for each source category. For source categories reported in NEDS as point sources, national emissions totals reported below are also based on one calculation, performed at the national level; in this calculation, use is made of available data on national industrial production and fuel consumption, other appropriate data, and national average emission factors. Where necessary, average level of pollution control is considered to estimate actual emissions. The methodology for EPA calculation of national emissions estimates is inherently less precise than that used to produce NEDS summaries and does not allow inclusion of emissions measured by calculation procedures for individual sources that may give more accurate emissions estimates than a standard emission factor calculation. The national calculation does not suffer from biases and omissions of sources to the same extent as NEDS point-source data, however. As a result, the national emissions totals presented in Table 1 are judged to be the most reliable estimates of national emissions available at this writing. EPA national emissions estimates are periodically revised as better emission inventory techniques and emission factors are developed. Updated national emissions estimates for 1977 will be presented in future editions of *National Air Pollutant Emission Estimates.*

Comparison of the national NEDS emissions totals with EPA-calculated national emissions estimates indicates reasonable agreement for most source categories. Notable discrepancies do exist in some cases, however. Some of these can be clearly traced to specific deficiencies in the NEDS data. Others involve more complex problems concerning differences in techniques used to produce the data. It is difficult to resolve these problems without an exhaustive review of NEDS data.

For stationary fuel combustion sources, significant discrepancies exist for particulate emissions from power plants and for NO_x emissions from industrial fuel combustion. The low emissions of industrial NO_x in NEDS, result from incomplete reporting of natural gas-fired turbines and reciprocating engines in the NEDS point source file. These sources, operated largely by natural gas pipeline and gas processing companies have significant NO_x emissions, but are minor sources of other pollutants. Particulate emissions from power plants are lower in NEDS than in Table 1. Calculation of particulate emissions involves the use of many variables including fuel amounts, fuel ash contents, degree of control employed, and either emission factors or State-supplied emissions estimates. Fuel amounts in NEDS agree closely with the fuel amounts used to calculate EPA National emission estimates. The difference in emissions is most likely caused by a combination of factors involving estimated fuel ash contents, degree of pollution control, and the use of State emissions estimates (based on stack emissions measurements, material balance, or engineering judgement) rather than emission factors to estimate emissions.

Industrial process emissions of particulates and hydrocarbons are lower in NEDS than in Table 1. Particulate emissions are lower because some industrial process sources are missing from or improperly reported in the NEDS point source file. Emissions may not be reported because (1) plants emitting less than 100 tons/year of particulates do not have to be included in the NEDS point source file or (2) engineers in State agencies who report the data do not have sufficient technical resources to estimate emissions for all sources. In the latter case, sources may be omitted entirely or incorrectly coded so that emissions cannot be properly reported in NEDS. This is particularly a problem for fugitive emissions from industrial processes. Table 1 includes rough estimates of fugitive particulate emissions from industrial processes. Due to the lack of engineering data on this subject, industrial process fugitive particulate emissions are only minimally reported in the NEDS point source file. Hydrocarbon emission estimates are lower because some petroleum storage facilities are missing from the NEDS point source file. In addition, the portion of industrial organic solvent use accounted for by point sources is relatively small. Table 1 includes all industrial organic solvent use under industrial processes and non-industrial organic solvent use under miscellaneous solvent evaporation loss. In NEDS, missing industrial solvent use is accounted for as area source solvent use instead. As a result, the NEDS emissions shown for miscellaneous area source solvent evaporation loss are higher than in Table 1, but the total point and area source emissions from organic solvent use are approximately the same.

NEDS calculated emissions of hydrocarbons and CO from highway motor vehicles are slightly higher than in Table 1. This results from the use of county-specific emission factors in NEDS which consider whether the county is in a low altitude area, a high altitude area, or in California where motor vehicle emission standards different from the national standards apply. For calculation of EPA national emission estimates given in Table 1 low altitude average emission factors were used. Emission rates per vehicle-mile for hydrocarbons and CO are higher in high altitude areas than in low altitude areas. Since the NEDS calculation procedure considers these factors, the NEDS emission estimates are probably more accurate than the EPA-calculated national emission estimates for highway vehicles.

Fugitive Dust Sources

The 1977 NEDS National Emissions Report includes, on an experimental basis, estimated particulate emissions from area sources of fugitive dust. Estimated emissions from vehicle travel on unpaved roads and aircraft operations on unpaved airstrips are included as miscellaneous sources. Estimated emissions from entrainment of dust from paved roads are included with highway vehicle particulate emissions. Source categories are also defined for construction, land tilling, and miscellaneous wind erosion. No emissions are reported for these categories due to lack of suitable emission factors and NEDS source inventory techniques. The emission estimates for unpaved roads and entrainment of dust from paved roads should be regarded as preliminary, order of magnitude emission estimates. Improved emission estimates will be developed upon future availability of better emission inventory techniques and refined particle size data for these sources.

The estimated emissions from these fugitive dust sources are quite large. It is improper to assume that the air quality impact of these emissions is similarly significant. A major portion of the emissions from these sources consist of large particles which settle to the ground a short distance from the source. NEDS emission estimates include only estimated emissions of particles less than 30 micrometers in diameter, the maximum size particle that would be efficiently captured by standard particulate air quality sampling equipment. Available particle size

data, particularly for entrainment of dust from paved roads, may overestimate the portion of particles under 30 micrometers in size. It should also be noted that since unpaved roads exist mainly in rural areas, that these emissions are spread over large land areas of low population density. These factors limit the impact on air quality of these sources.

Tabulated Data from NEDS

Nationwide emissions of the five criteria pollutants in 1977 are summarized by emission source category in the first table (page 1) of this report. The second group of tables presents a summary of air pollutant emissions for that year in individual states, in intrastate AQCRs, and in the portions of interstate AQCRs within each state. Air pollutant emissions data for each interstate AQCR are presented in the third group of tables.

Each table has the same format, with emissions shown for each defined NEDS source category. Area-source categories are identical to those defined in the NEDS area-source file. The *AEROS User's Manual* (EPA-450/2-029) gives a detailed definition of each area-source category. The following brief descriptions of selected area-source categories are presented as additional clarifying information.

Area-Source Category	Description
Gasoline-Light Duty Vehicles	Passenger vehicles (automobiles) with a gross weight less than 8500 pounds (3856 kg).
Gasoline-Light Duty Trucks	Gasoline powered cargo trucks with a gross weight less than 8500 pounds (3856 kg).
Gasoline-Heavy Duty Vehicles	Trucks and buses with a gross weight over 8500 pounds (3856 kg).
Off Highway	Off-highway vehicles include farm, construction, and industrial machinery, lawn and garden tractors, snowmobiles, and off-road motorcycles.
Gasoline Station Evaporation	This category represents evaporative emissions occurring at retail gasoline service stations from filling of underground storage tanks and vehicles tanks.
Forest Managed Burning	This category represents emissions from deliberate prescribed burning of forest and agricultural wastes as a standard management practice.
Frost Control	This category represents emissions from the use of orchard heaters.
Solvent Evaporation Loss	This category represents an estimate of evaporative emissions from organic solvent use, not accounted for by point sources in NEDS.

Point-source data in the emissions summaries are grouped according to NEDS Source Classification Code (SCC) definitions. A complete listing is given in *Compilation of Air Pollutant Emission Factors*, AP-42 and the *AEROS Manual of Codes* (EPA-450/2-76-005). A brief summary of the relationships between NEDS SCC categories and the emissions summary categories is given in the table on the next page.

Point-Source Category	SCC	Description
External Combustion-Electric Generation	101	Power-plant boiler fuel use
External Combustion - Industrial	102	Industrial boiler fuel use
External Combustion - Commercial-Institutional	103	Commercial-institutional boiler fuel use
Internal Combustion - Electric Generation	201	Power-plant fuel use in turbines and reciprocating engines
Internal Combustion - Industrial	202	Industrial turbines and IC engines
Internal Combustion - Commercial-Institutional	203	Commercial-institutional turbines and IC engines
Internal Combustion - Engine Testing	204	Testing of aircraft and rocket engines
Industrial Process - Chemical Mfg.	301	Chemical production
Industrial Process - Food/Agriculture	302	Food and grain processing
Industrial Process - Primary Metal	303	Primary iron/steel, aluminum, copper, etc.
Industrial Process - Secondary Metal	304	Foundries, secondary metal smelting
Industrial Process - Mineral Products	305	Stone, clay, and glass
Industrial Process - Petroleum Industry	306	Petroleum refining
Industrial Process - Wood Products	307	Pulp and paper, plywood, and sawmills
Industrial Process - Organic Solvent Evaporation		Dry cleaning (401001), degreasing (401002), surface coating (402), and miscellaneous (490) point source organic solvent users
Industrial Process - Petroleum Storage/Transport		Storage of petroleum products (403, 404) and transportation and marketing losses (406)
Industrial Process - Metal Fabrication	309	Hardware, machinery manufacturing
Industrial Process - Textile Mfg.	330	Fabrics and carpet operations
Industrial Process - Other/Not Classified	399	Industrial processes not identified above
Solid Waste Disposal	5	Municipal incinerators and open burning dumps (501), commercial incinerators and open burning (502) and industrial incinerators and open burning (503)

PART A

SUMMARY OF AIR POLLUTANT EMISSIONS IN THE UNITED STATES

UNITED STATES

Emission categories	Pollutant, tons per year				
	Particulates	Sulfur oxides	Nitrogen oxides	Hydro-carbons	Carbon monoxide
GRAND TOTAL	**53,424,350**	**31,477,757**	**21,736,603**	**27,737,227**	**113,715,311**
-AREA	**45,731,590**	**2,441,270**	**10,679,474**	**22,144,188**	**105,108,057**
-POINT	**7,692,760**	**29,036,487**	**11,057,129**	**5,593,039**	**8,607,254**
